

Project 2 :: Milestone 1

There are a few ideas for this project that I think would be helpful for me in my daily life, the first being:

As a college student it is hard to keep up with all your tasks you need to do in your day to day. As your todo list grow bigger it gets harder to get motivated to knock out think on your list, but what if you had a little incentive to get them done? With this app for project 2 I want to make a todo list that, with every item completed, you get points for accomplishing a task. These points could then be redeemed at various places for special offers such as discounts, free items or whatever the business wants to offer.

There are hundreds of to do list apps but i think what would make this one stand out from the others is how you collect points for completing things. There is one app i have in mind, pockets points, which has this same sort of reward system implemented and is where i adopted this idea. I think, however, that this one would help the user be more productive by using it and being rewarded for doing so. Obviously at this point i would not be able to actually implement the redeeming of the points as i don't have time time not resources to set up business partners so, technically speaking, i would just be implementing a todo app.

My second idea is to remake my app from project one and refine it so that the user will be able to interact with it better. I also think that it would be beneficial to develop this app again on a different platform because app developers who can write both languages have the upper hand on one's who can only do one. This would be a way for me to see an app come full circle and be available on both platforms.

I have prepared prototypes for both and hope that the feedback i get will help guide me to make the decision that would help me most!
