Mobile App Dev

Milestone 2

First and foremost here is the link to my Invision.io mock up:
        https://invis.io/D9DTJW735

Note that this is more of a planned demo as invision does not allow for input/output with keyboards and number keys. I tried my best to cover all the grounds of the functionality but here is some code that will explain how the numbers will be updated:

```
Var income = user input for income

//Adding new budget
if(budget plus is pressed){
        Var budgetName = user input for name
        Var budgetAmount = user input for amount

        Create row for new budget item
}

//Updating remaining income
Var income = income - budgetAmount

//inside specific budget
if(add amount is pressed){
        Var newAmount = user input amount

        Create row for new imput

        Var remainingAmount = budgetAmount - newAmount
        Return remainingtAmount
}
```
