Mobile App Dev

Milestone 2

First and foremost here is the link to my Invision.io mock up:
        https://invis.io/62EQN1ZH8

        As in project one this demo is not fully comprehensive but i tried to cover most of the functionality.

        For this project i took my concepts from project one and did a lot of UI redesign to make it more user friendly. I am utilizing text field along with a spinner to select the categories to make inputs into them. Unlike the first project I am making this one a single page view which i think will be more intuitive to users. This will, however, not have a page in which you can see the line items of everything you input which is one functionality i would like to add later on.

```
Var income = user input for income

//Adding new budget
Var food = user input for food

Var gas = user input for gas

Var spending = income - food - gas //left over budget after inputed data

//Adding line items

If spinner.value = 1{
        Var FoodInput = user input from feild
        Var remainingFoodBud = food - FoodInput
}
If spinner.value = 2{
        Var GasInput = user input from feild
        Var remainingGasBud = Gas - GasInput
}
Else{
        Var spendingInput = user input from field
        Var remainingSpendBud = spending - spendingInput
}
```
